SCHOLARS AT RISK
N E T W O R K

Science always opens doors for you.

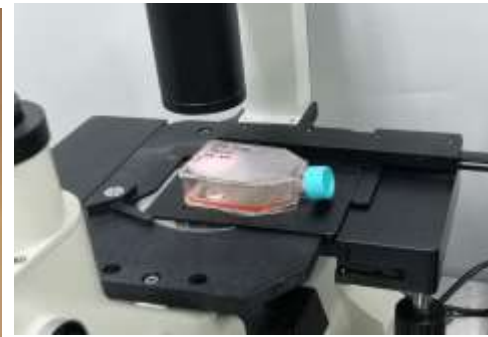

Where I have been to take study/training to become a biologist.

Challenges vs Threats

When you have a chance to follow your passion, grab it.

If there is one place that can provide all that for you, you are lucky.

Scientific-academic freedom; and the challenges related to the continuity and sustainability of a research condition

Learn the host country's language, finding time for that

The high competition to find positions to continue research; roles and conditions

The lack of knowledge about the roles and bureaucracy of the hosting country

Busy between doing research, producing research outputs and proving yourself; **finding positions and opportunities**; adjusting to the new environment; **keep up with the challenges faced**

Fluctuating psychological state; Past traumas / **unstable present** / vague future
